

Mental Log Easy

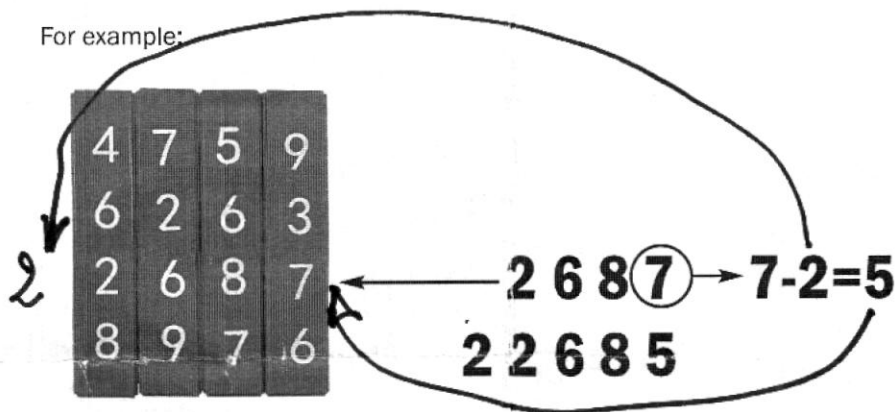

EFFECT:

The performer shows the spectators four small rods with four different numbers on each of their sides. The spectator is invited to toss the rods on the table, assemble them, and then sum up on a Calculator (or on their telephone) the 16 numbers on the top sides of the rods. While the spectator is starting to just digit the first number, the performer immediately calls out the total! This can be repeated as many times as desired, and always with a different result. The effect for the spectators is that you are a human computer able to add many different numbers in the blink of an eye.

SECRET:

The third row of the numbers is the secret! If you subtract 2 from the last digit in the third row and put it before the first digit in the third row you will have the total.

For example:

In the box above you subtract 2 from 7, and add it before the 2, so the total is 22685. The system is the same regardless of the number of log used. If a single log was used, and it showed a 5 in the third row, the total of the numbers on that log would be 23. If two logs were used and the number in the third row was 45, the total of those two logs would be 243. And so on.
